

Case Study Rubric

Spec Category	Spec Details
Formatting	• Repository: GitHub repository containing all materials, submitted via a link on Canvas ○ Contents ▪ README.md file (auto displayed) ▪ LICENSE.md file (use MIT as default) ▪ DATA folder ▪ SCRIPTS folder ▪ OUTPUT folder ▪ Writeup ▪ References
README	• <u>Goal:</u> This file serves as a map to everyone who views your repository • Use the markdown format to explain the content of the repo concisely • It should include a section describing every important folder in the repo • Map of your documentation: create an outline or tree illustrating the hierarchy of folders and subfolders contained in your project repo • Instructions for reproduction: you should give explicit instructions that cover how to reproduce the results of your study without difficulty
LICENSE	• <u>Goal:</u> this file should explain to a viewer the terms under which they can use or cite your repo • Usually, the MIT license is appropriate
SCRIPTS folder	• <u>Goal:</u> this folder contains all the code used to create the results in the case study • Include all scripts that you use • Use markdown or code comments to denote any changes made to the existing scripts of the provided case study • Scripts should include headers and comments in all cases describing the purpose of the code
DATA folder	• <u>Goal:</u> this folder contains all the data analyzed in this project

	● If attempting to replicate the project with new data such as data from a different power market/ISO or more recent data from MISO, add the new data to the repo and denote that it is new data ● If your data does not fit in GitHub, use a single file explaining how to access and download all necessary data
OUTPUT folder	● <u>Goal</u>: this folder should contain all of the output generated by the project ● This should include figures, tables, charts, etc. ● Like above with the DATA folder, denote if any of the newly generated output uses a different dataset, different modeling approach, etc.
Writeup	● <u>Goal</u>: to analyze the results of the case study and evaluate the reproducibility of the original project ● Write an approximately 1-page analysis summarizing the case study ● Discuss several findings and observations in more depth ● Provide graphics from your output in the document to support your findings
References	● All references should be listed in a document in the repository ● Use IEEE Documentation style (link)
